

Appl. No. 09/678,933

In the Claims

1. (currently amended) A method of securely connecting a plurality of client computers to computer resources in a shared computer system, comprising:

5 associating each of said plurality of client computers with at least one virtual private network connection, wherein said plurality of client computers are remotely connected to at least one virtual private network termination device in said shared computer system, said shared computer system comprising an
10 application service provider, and wherein said at least one virtual private network connection is established by said at least one virtual private network termination device;

15 associating said at least one virtual private network connections with a plurality of virtual local area networks; and

20 associating at least one of said computer resources in said shared computer system with each of said plurality of virtual local area networks, whereby a domain for each of said plurality of client computers is extended to include said computer resources in said
application service provider and said plurality of client
25 computer domains are isolated from each other within said application service provider.

2. (original) The method of claim 1, wherein each of said at least one virtual private network connections is uniquely associated with one of said plurality of virtual local area networks, so that a one to one correspondence exists between
30 said at least one virtual private network connection and said plurality of virtual local area networks.

Appl. No. 09/678,933

3. (original) The method of claim 1, wherein a plurality of said at least one virtual private network connections is uniquely associated with one of said plurality of virtual local area networks.

5 4. (original) The method of claim 1, further comprising a configuration engine in said shared computer system configuring at least one virtual local area network switch to establish said plurality of virtual local area networks.

10 5. (original) The method of claim 1, further comprising a configuration engine in said shared computer system configuring said at least one virtual private network termination device to establish said at least one virtual private network connection.

15 6. (original) The method of claim 4, further comprising said configuration engine reading computer requirements from at least one client.

20 7. (original) The method of claim 6, further comprising said configuration engine calculating an optimum allocation of said plurality of computer resources to meet said computer requirements of said at least one client.

25 8. (original) The method of claim 4, further comprising said configuration engine configuring said at least one virtual local area network switch to connect at least two of said plurality of client computers to a same one of said plurality of virtual local area networks.

9. (original) The method of claim 1, wherein at least one of said plurality of client computers is connected to said

Appl. No. 09/678,933

shared computer system across a dedicated line.

10. (original) The method of claim 1, wherein at least one of said plurality of client computers is connected to said shared computer system across the Internet.

5 11. (original) The method of claim 10, wherein at least one of said plurality of client computers is connected to said shared computer system with a modem.

10 12. (original) The method of claim 10, wherein at least one of said plurality of client computers is connected to said shared computer system with a broadband connection.

15 13. (original) The method of claim 1, said shared computer system further comprising computer readable program code for authenticating client computer identification, said method further comprising executing said computer readable program code to authenticate client computer identification before associating each of said plurality of client computers with at least one virtual private network connection.

20 14. (original) The method of claim 1, said shared computer system further comprising at least one firewall, said method further comprising configuring said at least one firewall to accept data from each of said plurality of client computers.

25 15. (original) The method of claim 14, further comprising a configuration engine in said shared computer system configuring said at least one firewall to accept data from each of said plurality of client computers.

Appl. No. 09/678,933

16. (original) A secure computer system, comprising:

a plurality of computer resources;

at least one virtual local area network switch
electrically connected to said plurality of computer
resources;

at least one virtual private network termination
device electrically connected to said at least one
virtual local area network switch, wherein said at least
one virtual local area network switch is configurable to
changeably connect a plurality of virtual private network
connections in said at least one virtual private network
termination device to at least one of said plurality of
computer resources while isolating said plurality of
virtual private network connections from one another; and

a configuration engine electrically connected to
said at least one virtual local area network switch, said
configuration engine comprising computer readable program
code for configuring said at least one virtual local area
network switch to changeably connect each of said
plurality of virtual private network connections to at
least one of said plurality of computer resources while
isolating said plurality of virtual private network
connections from one another.

17. (original) The secure computer system of claim 16,

wherein said computer readable program code in said
configuration engine further comprises code for a graphical
user interface to manually configure said virtual local area
network switch.

18. (original) The secure computer system of claim 16,

wherein said computer readable program code in said
configuration engine further comprises code for automatically

Appl. No. 09/678,933

configuring said virtual local area network switch.

19. (original) The secure computer system of claim 16,
wherein said computer readable program code in said
configuration engine further comprises code for reading client
5 computer requirements across said plurality of virtual private
network connections.

20. (original) The secure computer system of claim 16,
further comprising at least one firewall connected to said
plurality of virtual private network connections.

10 21. (original) The secure computer system of claim 16,
further comprising computer readable program code for
authenticating identification of client computers connected to
said plurality of virtual private network connections.

15 22. (currently amended) A secure computer system,
comprising:

a plurality of computer resources within an
application service provider;

20 means for securely connecting each of a plurality of
client computers to a portion of said plurality of
computer resources in said application service provider
while isolating said portion of said plurality of
computer resources from a second portion of said
plurality of computer resources.
